

ActuaryGPT — Underwriting Report

Confidential actuarial risk assessment & premium recommendation report.

1. Customer & Policy Profile

Age (Normalized)	0.23	Gender	Male
Height (cm)	175.0	Weight (kg)	70.0
BMI	22.9	Product Info 2	A1
Occupation	worker	Annual Income	\$305,000.00
Insurance Type	Life	Coverage Amount	\$60,000.00

2. Risk Analysis & Premium Pricing

Predicted Risk Class	Class 1 of 8
Risk Category	Low Risk
Recommended Annual Premium	\$10,000.00

3. AI Actuarial Analysis

The recommended premium of \$10,000 for \$60,000 life insurance coverage for this profile, assigned to Risk Class 1, is primarily influenced by several key factors as interpreted by our model.

1. ****Smoker Status:**** The most significant factor driving this high premium, especially for life insurance, is the indication of the applicant as a `smoker`. Smoking is consistently associated with significantly increased health risks and a higher mortality rate, leading to substantially higher life insurance premiums across all age groups.
2. ****Coverage Amount:**** The requested coverage amount of \$60,000 directly contributes to the base premium calculation. Higher coverage amounts naturally result in higher premiums.
3. ****Age (0.23 years):**** While very young, for life insurance on an infant, premiums can be sensitive to any perceived elevated risk factors.

****Contradiction and Recommendation:****

While the profile is assigned to 'Risk Class 1' (which typically suggests a lower risk category), the premium of \$10,000 for \$60,000 coverage is exceptionally high for standard life insurance, particularly for such a young individual. This strong disparity primarily stems from the 'smoker' flag.

****We strongly recommend verifying the accuracy of the 'smoker' status for an applicant aged 0.23 years.**** If the 'smoker' status is incorrect for this profile, it would lead to a substantial reassessment of the risk and likely a significantly lower premium.

Other factors such as a healthy BMI, no previous claims, no adverse family history, and positive lifestyle indicators (exercise, no alcohol) are favorable, but their positive impact is currently overshadowed by the `smoker` status in our model's calculation.

4. Sign-off & Recommendation

Based on the predictive model output and AI underwriting guidelines, the premium recommendation is formally calculated at **\$10,000.00** per annum. The underwriting team should perform secondary manual verification if the risk class exceeds Class 5.
