

ActuaryGPT — Claims Intelligence & Forensic Dossier

Autonomous Agentic AI Claims Verification & Risk Report

1. Primary Entities & Claim Profile

CUSTOMER	Name: officer@shield.com Email: ahan@gmail.com Phone: +91 98765 43210 Occupation: professional
VEHICLE	Make/Model: Unknown Unknown (2015) Vehicle No: MH-12-PQ-4567
CLAIM DETAILS	Claim ID: VEH-7C36AC Type: Single Vehicle Collision Incident Date: 2026-06-20 Claim Amount: ₹0.00

2. Forensic Analytics & Risk Assessment

Fraud Probability	2.4%
Confidence Score	97.6%
Underwriting Recommendation	Approved

3. AI Explanation & Decision Rationale

Explanation Summary:

- The claim amount is consistent with the accident severity.
- Customer has no previous fraud history.
- The damage pattern matches historical approved claims.

Detailed Forensic Log:

Claim Auditing Report: VEH-7C36AC

Date: July 29, 2024

Claim ID: VEH-7C36AC

Client: officer@shield.com

Auditor: AI Agent - Expert Vehicle Claims Auditor

1. Incident Risk Assessment

* **Incident Type & Severity:** The claim details report a 'Single Vehicle Collision' with 'Minor Damage' resulting from a 'Side Collision'. No property damage or bodily injuries have been claimed (Rs. 0.0 each).

* **Incident Timing:** The incident occurred at 12:00 PM, which is generally considered a lower-risk hour for accidents

compared to late-night or early morning periods.

* **Authorities Contacted:** Police were reportedly contacted; however, a 'Police Report is NOT available'. While not definitive of fraud, this lack of a formal report despite police involvement is a minor warning sign.

* **Customer History:** The insured has been a customer for 24 months (2 years), indicating a relatively new relationship with the company.

* **Geographical Discrepancy (CRITICAL):**

* Both the `policy\_state` and `incident\_state` are listed as 'NY' (New York), with the `incident\_city` as 'Springfield'.

* **As per our strict operational guidelines, all policies and claims managed by this Indian insurance company are based in India.** This fundamental geographical mismatch is a critical discrepancy. It strongly indicates either a significant data entry error, a test claim, or a claim that falls outside our jurisdictional purview. This is the primary concern requiring immediate clarification.

2. Comparative Analysis

The Machine Learning Classifier identified three historical claims with high similarity from the RAG (Retrieval-Augmented Generation) context:

* **Claim VEH-962591:** Client: customer1, Similarity: 96.4%, Fraud Flag: N, Status: approved

* **Claim VEH-476839:** Client: customer1, Similarity: 96.2%, Fraud Flag: N, Status: approved

* **Claim VEH-164464:** Client: customer1, Similarity: 95.3%, Fraud Flag: N, Status: approved

These highly similar historical claims were all classified as non-fraudulent ("N") and were ultimately approved. This suggests that, *in terms of incident type, severity, and other general parameters*, this claim aligns well with a profile typically considered low-risk and legitimate by our models.

It is noted that the `similar\_cases` directly embedded in the raw claim data (VEH-7821, VEH-894F7F) showed lower similarity (55.8%) and were flagged for fraud ("Y") with substantial claim amounts (Rs. 7,88,500 each, converted from \$9,500 USD). However, due to their lower similarity, the RAG context cases with higher similarity are given precedence in this analysis.

3. Anomaly & Fraud Detection

Despite the high confidence from the ML Classifier (97.6% prediction of 'N' for fraud) and the alignment with non-fraudulent historical cases, several significant anomalies have been detected that warrant a detailed manual investigation:

* **Zero Claim Amount (MAJOR ANOMALY):** The `total\_claim\_amount` is reported as **Rs. 0.0**. This includes `vehicle\_claim`, `property\_claim`, and `injury\_claim` all being Rs. 0.0. For a 'Single Vehicle Collision' described as having 'Minor Damage', it is highly irregular for no financial loss or repair cost to be claimed. This contradicts the very nature of an insurance claim for a collision. This could indicate:

* A critical data entry error where the actual claim amount was not recorded.

* The claim form was submitted purely for incident reporting without financial implications, which is not the typical purpose of a claim application.

* The claim is a test case or a placeholder.

* **Geographical Mismatch (CRITICAL RED FLAG):** As detailed in Section 1, the `policy\_state` and `incident\_state` are specified as 'NY'. This is a fundamental contradiction to the company's operational mandate in India and requires immediate verification of policy jurisdiction.

* **Lack of Police Report:** The claim states police were contacted, but `police\_report\_available` is 'NO'. This inconsistency

is a minor red flag.

* **Unknown Vehicle Details:** The `auto\_make` and `auto\_model` are both listed as 'Unknown'. While not necessarily fraudulent, this lack of specific vehicle information could hinder the assessment of damages if a valid claim amount were eventually submitted.

* **Actuarial Report Contradiction:** The provided 'Actuarial Report' (compiled via a fallback system) states: "Automated audit verifies that incident severity (Minor Damage) and total claim amount (\$0.0) are aligned with historical records." This statement is internally inconsistent; 'Minor Damage' typically implies some repair cost, not zero. If a claim truly has Rs. 0.0 payout, the incident should arguably not be classified as a "collision" requiring a financial claim.

The `policy\_deductable` is Rs. 41,500 (converted from \$500.00 USD) and the `policy\_annual\_premium` is Rs. 83,000 (converted from \$1,000.00 USD). These are significant figures, further emphasizing the anomaly of a Rs. 0.0 claim payout.

4. Auditing Recommendation

Given the critical discrepancies, especially the geographical mismatch and the anomalous zero claim amount for a reported collision with minor damage, this claim **cannot be approved for payout in its current state.**

Recommendation: FLAG FOR IMMEDIATE MANUAL CLAIMS INVESTIGATION

Specific actions required from the Claims Team:

- Jurisdictional Verification:** Immediately contact the client and relevant policy departments to verify the actual `policy\_state` and `incident\_state`. If the policy or incident indeed falls outside India, the claim must be rejected on jurisdictional grounds. If it's a data entry error, correct the policy and incident location to an appropriate Indian state/city.
- Clarification of Claim Amount:** Investigate thoroughly why a 'Single Vehicle Collision' with 'Minor Damage' has a total claim amount of Rs. 0.0. Obtain clear documentation or a revised claim submission detailing any actual damages or financial loss.
- Obtain Police Report:** Request and obtain the official police report, if available, to corroborate the incident details.
- Update Vehicle Information:** Secure the correct make and model of the vehicle involved in the incident.

While the ML classifier indicates a low probability of fraud based on its patterns, the fundamental inconsistencies in the provided data make the claim invalid for automatic processing and necessitate immediate human intervention to ascertain its legitimacy and correct details.

4. Similar Historical Claims (RAG Context matches)

Claim Reference	Similarity	Decision	Amount
Claim VH1245	96%	Approved	■82,000
Claim VH1112	94%	Approved	■85,000
Claim VH1021	91%	Manual Review	■88,000

5. Authorizing Officer Verification & Sign-off
